

# Stove Top Cover - Measuring Instructions

This simple drawing depicts the underside of a stove top cover. The cover is made from 1/2" marine plastic. They are custom made for each type (brand) of marine stove. The longer (top exterior) edges of the cover are 3/16" (5mm) thick and extend over the 4 edges of the stove's fiddle. The interior portion of the cover is smaller than the fiddle allowing it to protrude 5/16" (8mm) towards the stove's grates/burners, effectively keeping it in place during the vessel's motion.

We do not charge extra for custom made Stove Top Covers. We already have the popular covers in our data base. Please call to check availability.

On custom orders we require the following dimensions:  
Height and width of the outside area which goes over, (on top) the fiddle, and the height and width of the inside area which will protrude (with clearance) inside the fiddle.

All Stove Top Covers are professionally finished with rounded tops and corners.

Feel free to call if you have any questions.
